将军阀的工作原理 OPERATION PRINCIPLE OF GENERAL VALVE

当阀门全开的状态下，塞子的通道与阀体的通道对齐，能保证理想的最低压力降。

当转动手轮，塞子将朝关闭的方向转动，同时带动阀片转动90度，当继续转动手轮，塞子将会下压，使阀片的两侧张开，阀片将紧紧的压在阀座上，使阀门关闭。

当手轮向反方向转动时，首先使塞子向上运动，使阀片与阀座脱离，继续转动手轮，使塞子带动阀片转动90度，最后塞子的通道与阀体的通道对齐，使阀门处于全开的状态。

该阀门的优点是阀门在开启的关闭过程中，阀片和阀座处于脱离状态，关闭的过程是零摩擦，不会使密封面磨损，同时密封采用软密封，使阀门在关闭时为零泄露。

When the valve is fully opened, the channel of plug is in alignment with the channel of valve body, which can ensure ideal and lowest pressure drop.
 When the hand wheel is turned, the plug will rotate toward the closing direction, and at the same time draft the rotation of valve disc by 90 degree. When the hand wheel is turned further on, the plug will be pressed down, and make the valve disc open to two sides, so that the valve disc will be in firm contact with the valve seat and close the valve.

When the hand wheel is turned inversely, first of all the plug will move upward, and the valve disc and valve seat will be separated, second the hand wheel shall be turned further on, till the valve disc is truned by 90 degree driven by the plug, finally the channel of plug will be in alignment with the channel of valve body, the valve is fully opened.

The advantage of this type valve is that there is no abrasion to the sealing face. Because during the opening and closing of valve, the disc and valve seat are separated, there is no friction between them. At the same time, the soft seal makes the valve zero leakage when valve closed.
